

Note: If you already have a Bitbucket account, skip the first two steps and proceed with creating a new workspace or using an existing one.

Creating a Bitbucket Account and Setting-up Workspace:

1. Visit Bitbucket:

- Open your web browser and go to <https://bitbucket.org/>.

2. Sign Up for an Account:

- Click the "Get it free" button and then click "Next".
- Fill in your email address.
- To complete setup and log in, click the verification link in the email they've sent to your email address.

3. Create Your Workspace:

- After signing in, you can create a new workspace or use an existing one. If you're creating a new workspace, follow these steps:
 - o Click on your profile picture or avatar in the top-right corner of the Bitbucket interface.
 - o Select "Workspaces."
 - o Click the "Create workspace" button.
 - o Provide a name for your workspace starting with a "u" and followed by your student ID (e.g., "u123456"). If your student ID contains non-numeric characters such as "." or "_", omit them. For example, if your student ID is "u123456.1," use "u1234561" as your workspace name.
 - o Click "Create Workspace."

Generating an Api Token:

4. Access Your Bitbucket Account:

- Log in to your Bitbucket account using your username and password.

5. Navigate to App Passwords:

- Click on your profile picture or avatar in the top-right corner of the Bitbucket interface.
- Select "Personal Bitbucket settings."

6. Generate an App Password:

- In the left sidebar, under "Access management," click on "App passwords."
- Click the "Go to API tokens" option.
- Click "Create API token with scopes"
- Name your api-key as "yourstudentnumber_token"
- Please select September next year(select the latest date you can choose)
- Please click "Next"
- Please select "Bitbucket"
- Please again click "Next"
- Please set "Results per page" to 50
- Please select all options
- Please click "Next"

- Then click “Create Token”

7. Copy the API Token:

- After generating the API token, it will be displayed on the screen. Copy it to your clipboard.

NOTE: YOU WILL NOT BE ABLE TO SEE THIS TOKEN AGAIN, SO KEEP IT SECURE.

Forking the Repository Using Bitbucket's User Interface

8. Sign in to Bitbucket

- Go to bitbucket.org
- Sign in with your Bitbucket credentials.

9. Access the Repository

- Once signed in, open the link to the repository:
<https://bitbucket.org/erdemturk/dblab2024/src/main/>
- This will take you to the repository's main page.

10. Fork the Repository

- At the top-right corner of the repository page, click the “...” icon (next to the Clone button).
- From the dropdown menu, select “Fork this repository.”

11. Configure the Fork

- **Repository Name:** Leave the repository name as dblab2024 (do not change it).
- **Project name:** You can name it as ceng3005
- **Workspace:** Select the workspace that you created at the beginning. The workspace name should start with "u" followed by your student ID (e.g., u123456).
- **Privacy:** Set the forked repository to **Public** so that we can view it.
- **Forking Settings:** Leave all other settings unchanged.

12. Create the Fork

- Once you have configured the settings, click the “Fork repository” button.
- Bitbucket will create a copy of the repository under your workspace.

13. Access the Forked Repository

- After the fork is complete, you will be redirected to the forked repository page.
- The repository is now under your workspace, and you can begin working on it independently.

Cloning the Forked Repository to Your PC:

14. Install Git (if not already installed):

- If Git is not already installed on your PC, download and install it from <https://git-scm.com/downloads>.
- Open a terminal or Git Bash on your PC.
- Navigate to the directory where you want to clone the repository.
- Clone the repository using the following command, replacing <your-username> with your Bitbucket username, <workspace-name> with the URL of your forked repository:

```
git clone https://<your-username>@bitbucket.org/<workspace-name>/dblab2024.git
```

- You will be prompted to enter the password you generated in step 7.

Committing a File to the Cloned Repository:

15. Create a "week1" Folder and Commit the File:

- Navigate to the root directory of your locally cloned repository using your terminal or Git Bash.
- Create a new directory named "week1" if it doesn't already exist
- Place the "MySQL_installation_instructions.docx" file that you want to commit into the "week1" folder.
- Add and commit the file to your repository using the following commands:

```
git add week1/MySQL_installation_instructions.docx
git config --global user.email <your_email>
git config --global user.name <your_username>
git commit -m "Initial commit"
```

Pushing the Changes to Bitbucket:

16. Push the Changes with App Password:

- After committing the file locally, you need to push the changes to your Bitbucket repository using your App Password.
- Use the following command to push the changes and when prompted, enter your Bitbucket username and App Password:

```
git push
```

17. Verify Changes on Bitbucket:

- Visit your Bitbucket repository page (e.g., <https://bitbucket.org/<workspace-name>/dblab2024>) to verify that the file has been added under the "week1" folder.
